

The face detecting, display controlling, energy saving Eco-Power Management tool from VeryPC

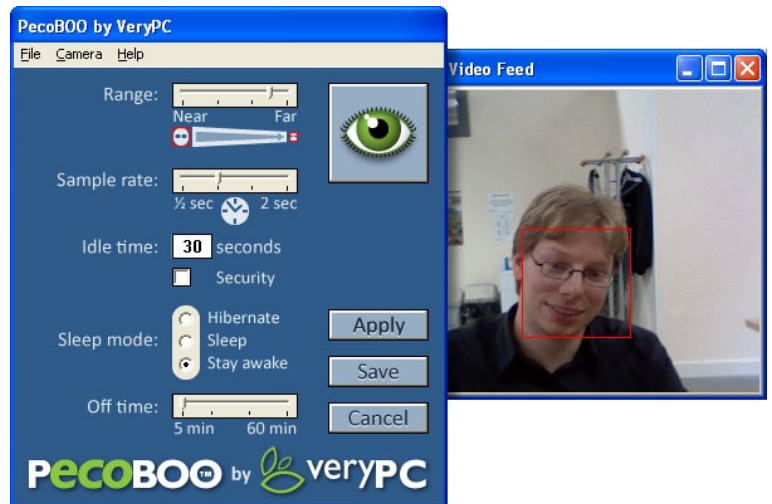

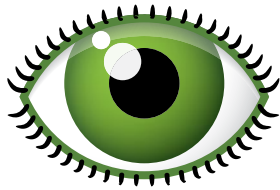

PecoBOO™ can see you

The energy saving application that knows when you're looking

PecoBOO™ utilises your webcam and some clever face detection programming to see whether you are sat in front of your display or not.

- When you're there, PecoBOO™ keeps your display on
- If you leave or turn away, PecoBOO™ turns off your display because it cannot see your face
- As soon as you return, PecoBOO™ sees your face and turns your display back on, ready to work

Why we need PecoBOO™

VeryPC™ customers are an energy conscious lot. You told us that you wanted more immediate, intelligent control of your computer's power settings. You said that the standard power management tools often interfered with your activities, such as viewing online video like the BBC iPlayer or referring to on-screen document for example. You told us that you often disabled the built in power settings for ease of use, then never got around to switching them back on. A new solution was required, we realised.

In the old days, your computer desktop unit would use far more energy than your display. Here at VeryPC™, we've put so much effort into making our PCs energy efficient, that we've flipped it around. Our computers now consume less power than their displays, so we had to invent a way to improve the energy management of your display. PecoBOO™ achieves this by taking the time delay and the user decision out of the equation. You just use your computer as normal, and PecoBOO™ makes sure you don't waste unnecessary energy when you are not using the computer.

Features and Benefits of PecoBOO™

- Immediate energy saving
- Passive control - takes the decision away from the user
- Multiple camera support
- Fully customisable settings
- Password protected display activation security option
- System sleep and hibernate functionality
